STUDY OF MECHANICAL AND CORROSION PROPERTIES OF DUPLEX STAINLESS STEEL WELD: OPTIMIZATION OF WELDING PARAMETERS.

Research Scholar: Ajith Gopinath, Assistant Professor, Christ University, Bangalore.

Guide: Dr. Bijayini Panda, Assistant Professor, CMR Institute of technology, Bangalore.

Synopsis

Introduction:

One of the most relevant and persisting problems faced by most of the industries worldwide over the years is corrosion. It can be defined as an undesirable deterioration of the material because of chemical, physical or biological changes. Constant researches to find corrosion resistant materials have been going on through years. Stainless steels are being used extensively in industries over a period of time as it minimizes corrosion to a certain extent [1].

Duplex stainless steel are one of the advanced stainless steels, often used in petrochemical and chemical industries due to their superior corrosion resistance. One of the typical examples being anchor bolts used for installing outdoor advertisement structures in ship building [1,6]. Due to their well-balanced austenite-ferrite ratio, these steels have been used extensively in severe corrosive environments and where superior mechanical properties are required. The high strength and corrosion properties are attributed to ferrite and the ductile behaviour is given by the austenitic phase [2]. Welding creates an imbalance in this austenite-ferrite ratio, due to which the corrosion properties and mechanical properties get affected [3]. Moreover, welding results in prolonged high temperature exposure of the duplex stainless steel which results in the formation of intermetallic phases. The intermetallic phases deteriorate the corrosion properties of duplex stainless steel [4]. To get the effective combination of both the properties, by the proper ferrite-austenite balance, the weld metal composition and the heat input has to be controlled [5].

Problem Definition:

Duplex stainless steel finds its application in petrochemical, chemical, ship building industry etc, where the rate of corrosion is higher because of the unfavourable conditions that persist in the environment, such as temperature variations, high salinity of the water. Therefore, need for having a high corrosion resistance to withstand these adverse conditions is necessary. Duplex stainless steel has inherent corrosion resistant properties and high mechanical properties due to its well-balanced austenite-ferrite ratio. However, welding of the steel may cause deterioration in its properties due to the formation of intermetallic phases and change in the austenite-ferrite ratio. Hence the welding parameters such as heat input and interpass temperature have to be varied and an optimum range of parameters has to be found out. The parameters have to be optimized in order to have an optimum combination of corrosion as well as mechanical properties.
